Technical Challenges

Data or Services?

Data or Services?

Distributed Journey Planning

Benefit for the user

- for multimodal journeys crossing regional/national borders one integrated service is lacking
- lacking cross-border and cross-operator information

Distributed Journey Planning

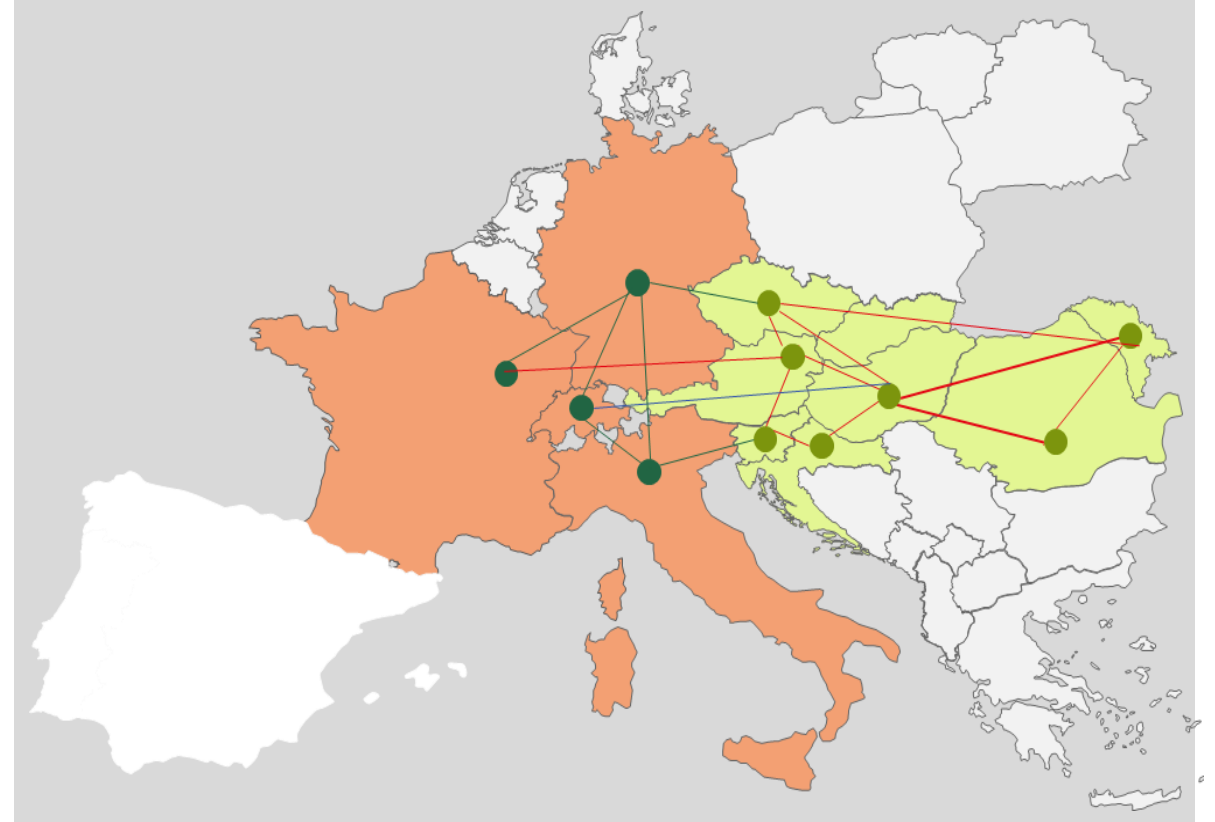

Benefit for the user

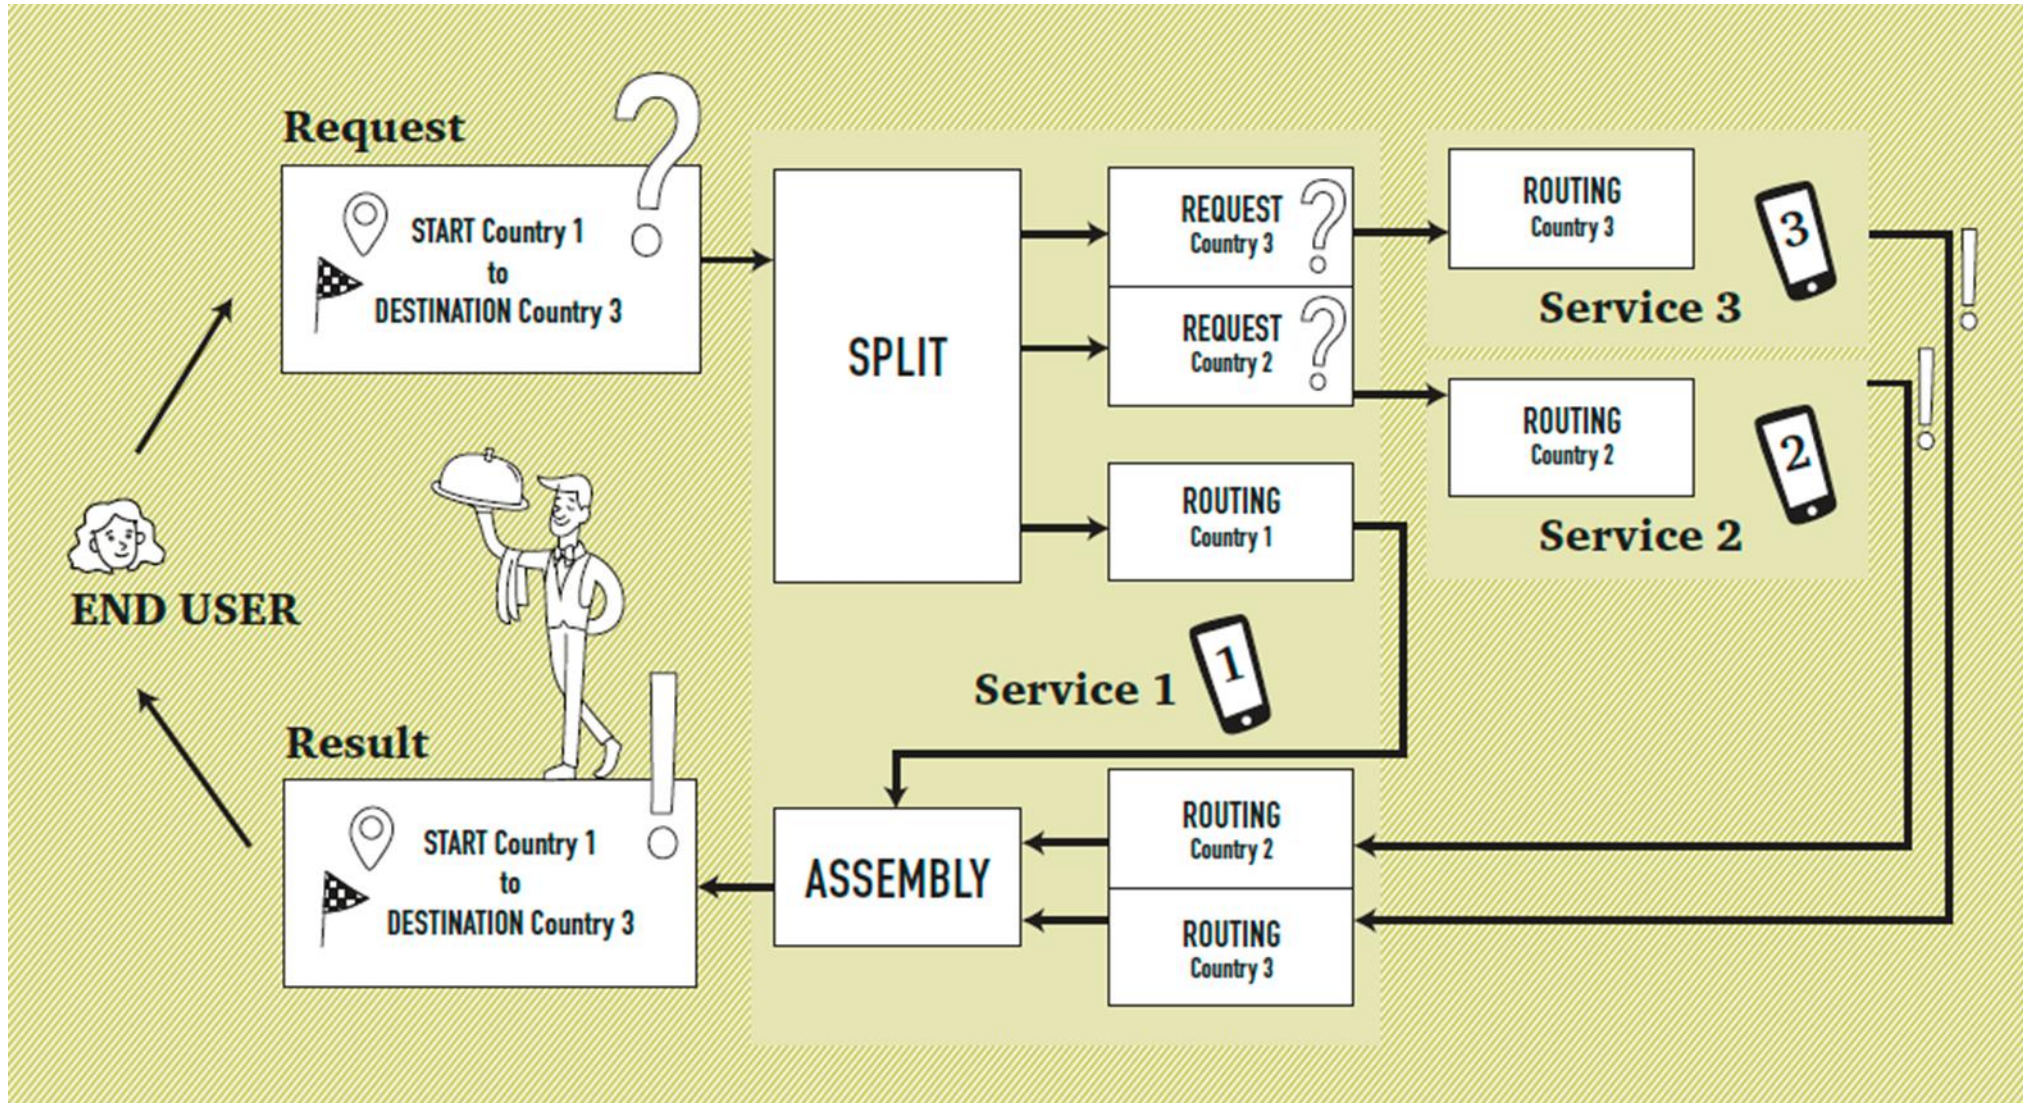

- Information of the highest quality and up-to-dateness
- Simplified access to information – well-known APP

Benefits of OJP – for operators

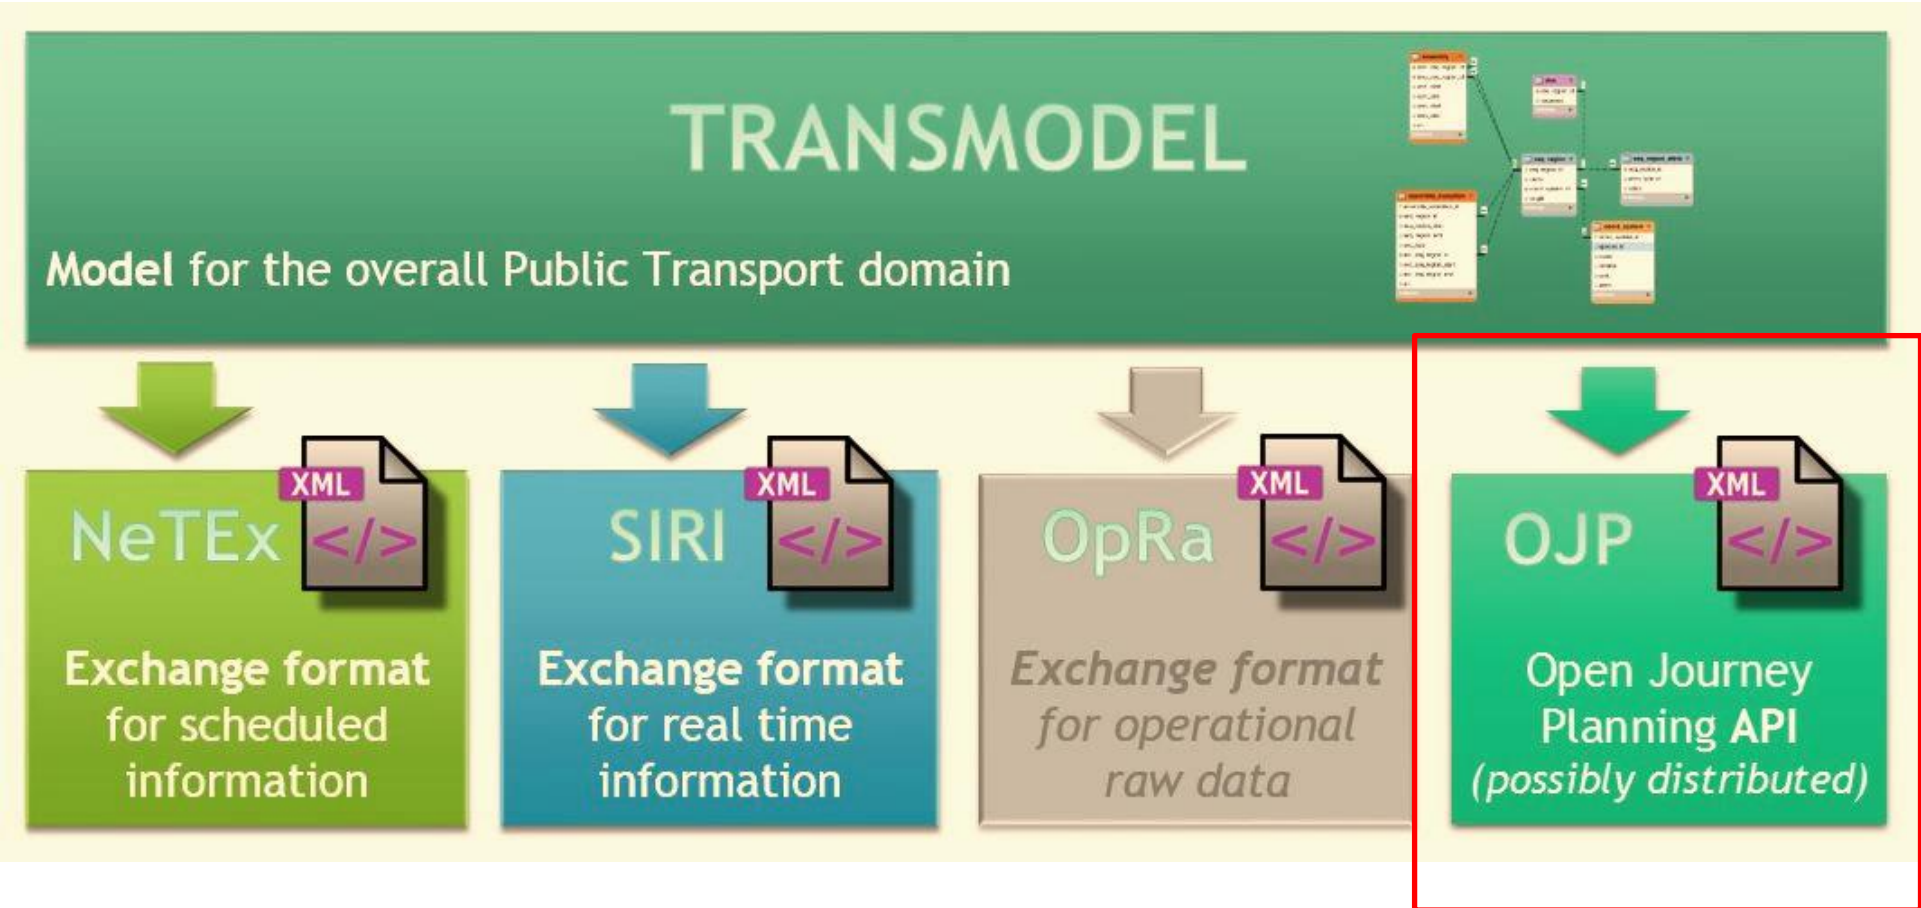

- **Sovereignty over data**
- Extension of the **range of the own system** by the coverage of all affiliated systems
- Thus, improvement of the **functionalities and quality of information** provision for customers
- **Strengthening the market position** of the local/regional service provider

Distributed Journey Planning

Standardisation – Public transport standards family

Standardisation

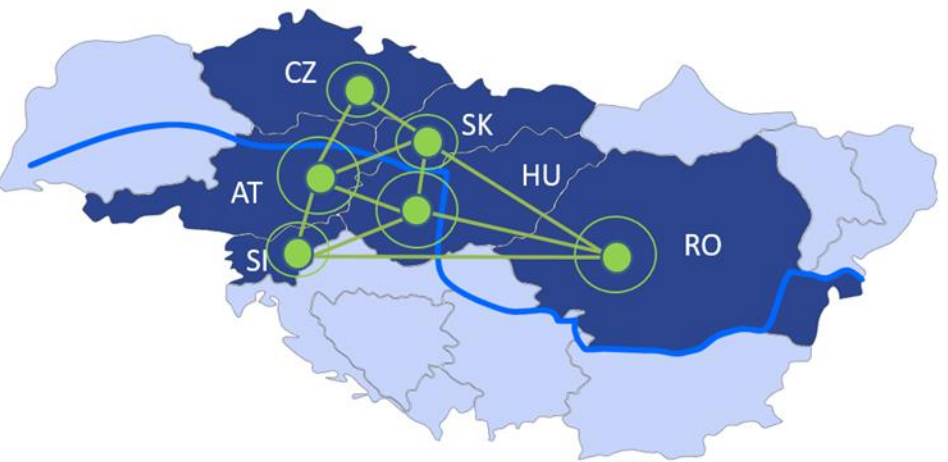

„OJP Standard“

Publishing of CEN Standard for “linking of services”

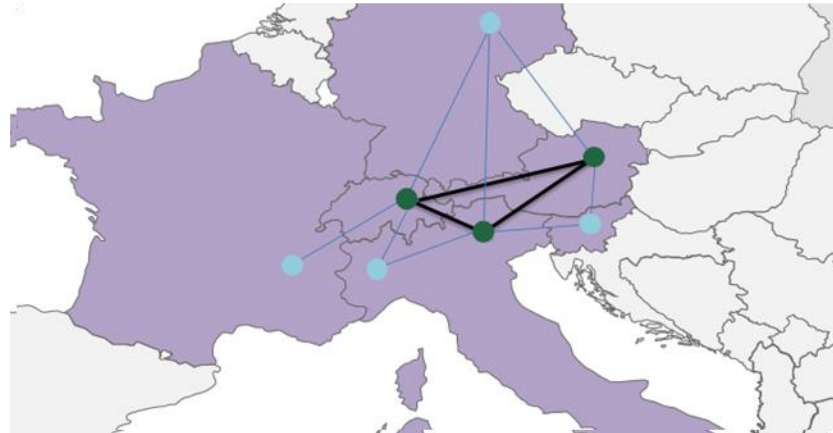

CEN/TS 177118 Public Transport –
Open API for distributed journey planning (2017)

Universal interface for service exchange

OJP initiatives

Harmonisation
(Profile!)
↔
Know-How exchange

OJP4Danube

LinkingAlps

OJP4Danube Project

Objective:

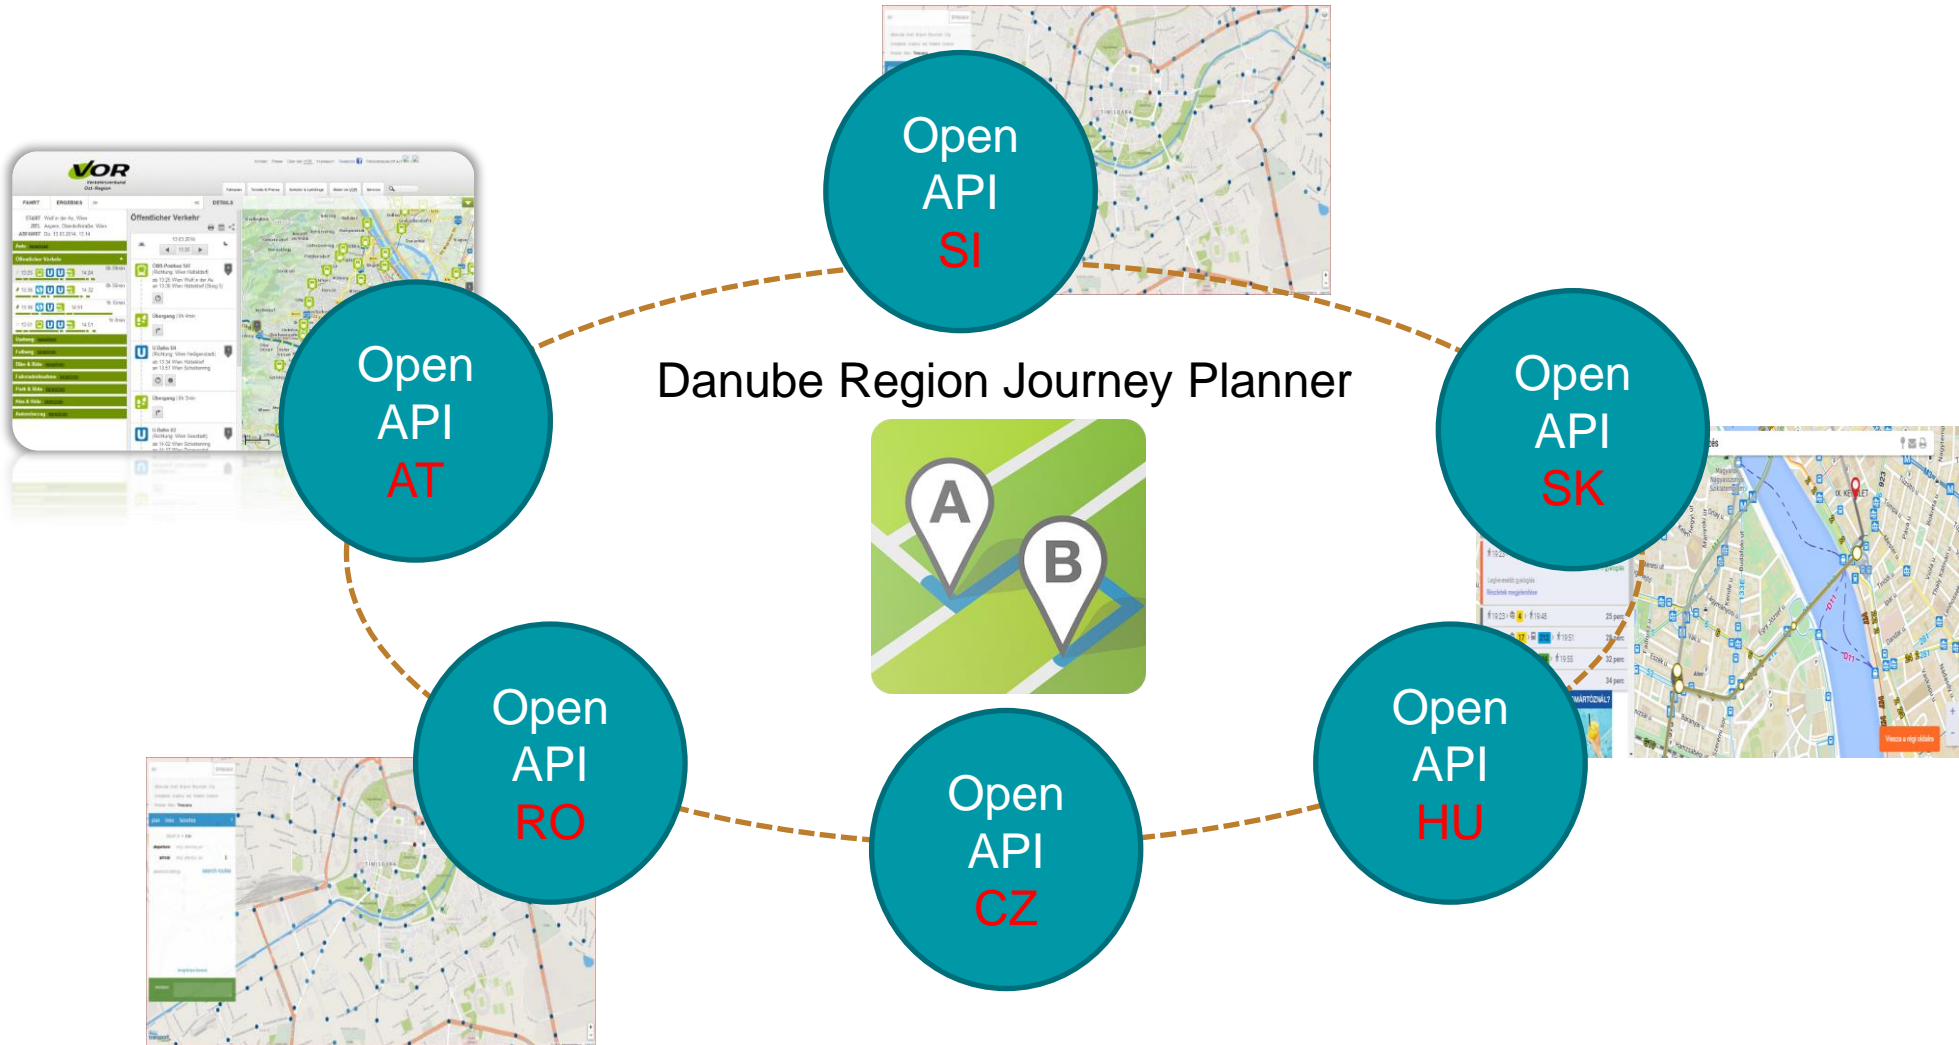

Create a transnational and cross-operator integration of the information into a single travel information service that will be tested, evaluated and demonstrated in an **end-user-service**.

(...). Particular focus will be on the integration of **cycling routes and relevant information for bike usage** in connection with other modes

OJP4Danube - Linked Journey Planners

Harmonized interfaces (OJP – APIs)

Implementability

TJP (RO)

F1: Walk distance **

F2: Bike onboard

F7: Bike parking

F8: Shared bikes

(*) Need to be integrated to PT journey planner (**) Needs to be implemented for cycling (***) Ljubljana only

User interface: selected cross border features

Walk/cycling distance:

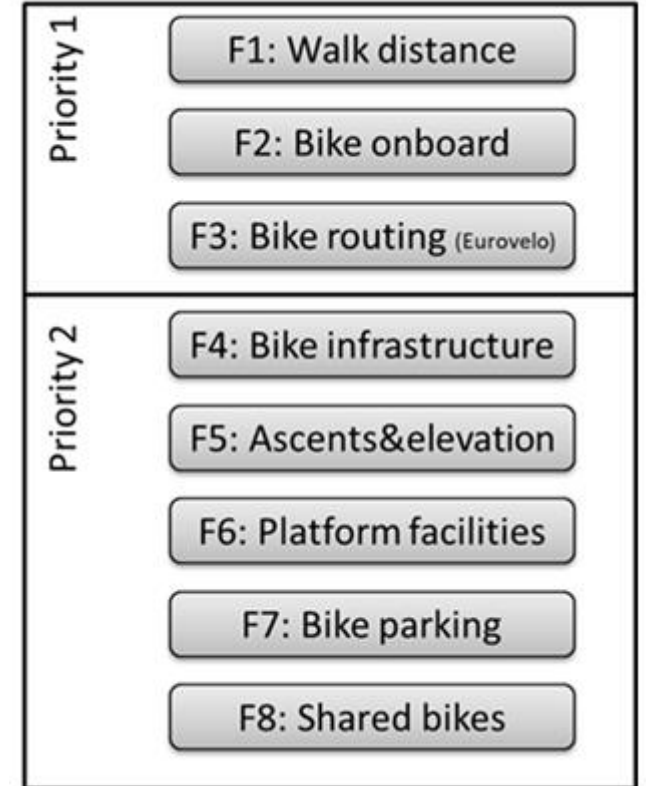

- Input: maximum walking and cycling distance, maximum speed, default
- Output: walking and cycling legs highlighted, display length

Bike-on-board:

- Input: check box, not hidden, one type of bike
- Output: static or real-time info available, but no reservation

Bike routing:

- Input: preference of using EUROVELO routes
- Output: label routes and instructions, crossborder connections highlighted

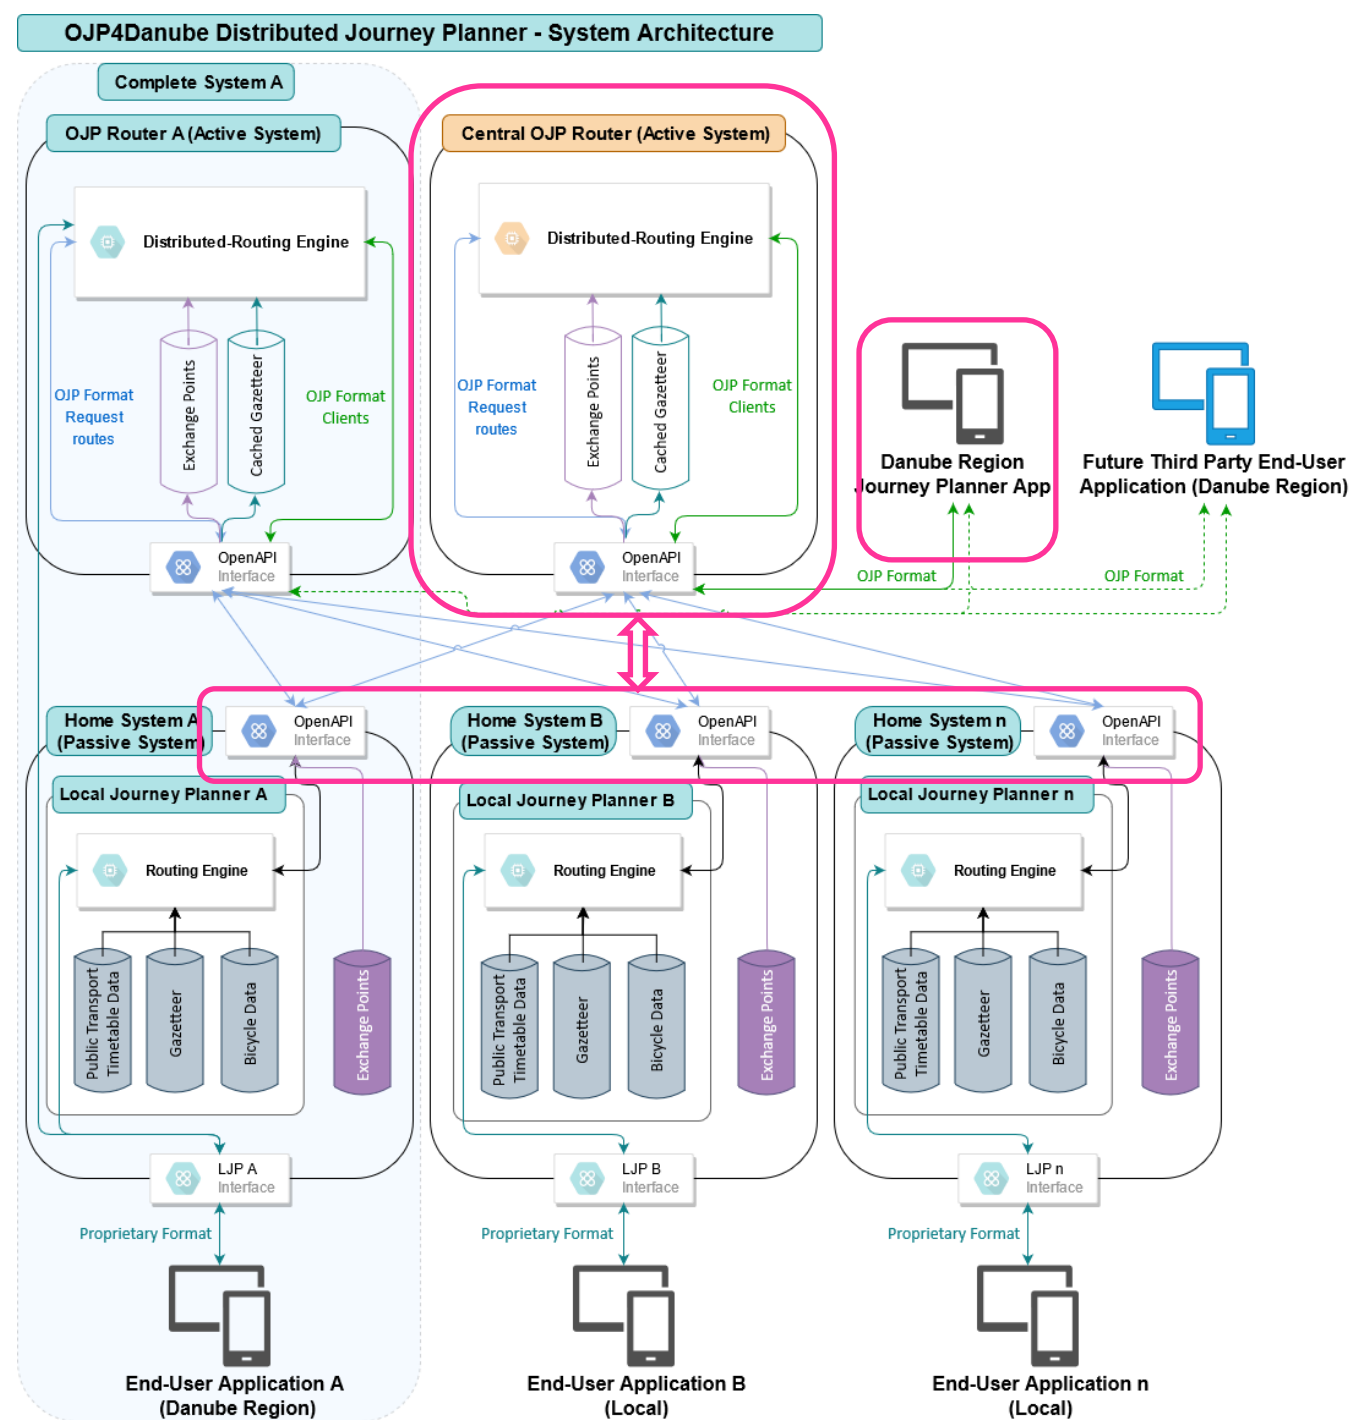

Architecture

Development:

- OJP Interfaces in all Passive Systems
- Development of the Active System (Central OJP Router)
- Development of the DJRP App

Integration:

- Integration testing between Active System and Passive Systems
- Harmonization / implementation adjustments if necessary in Active / Passive Systems

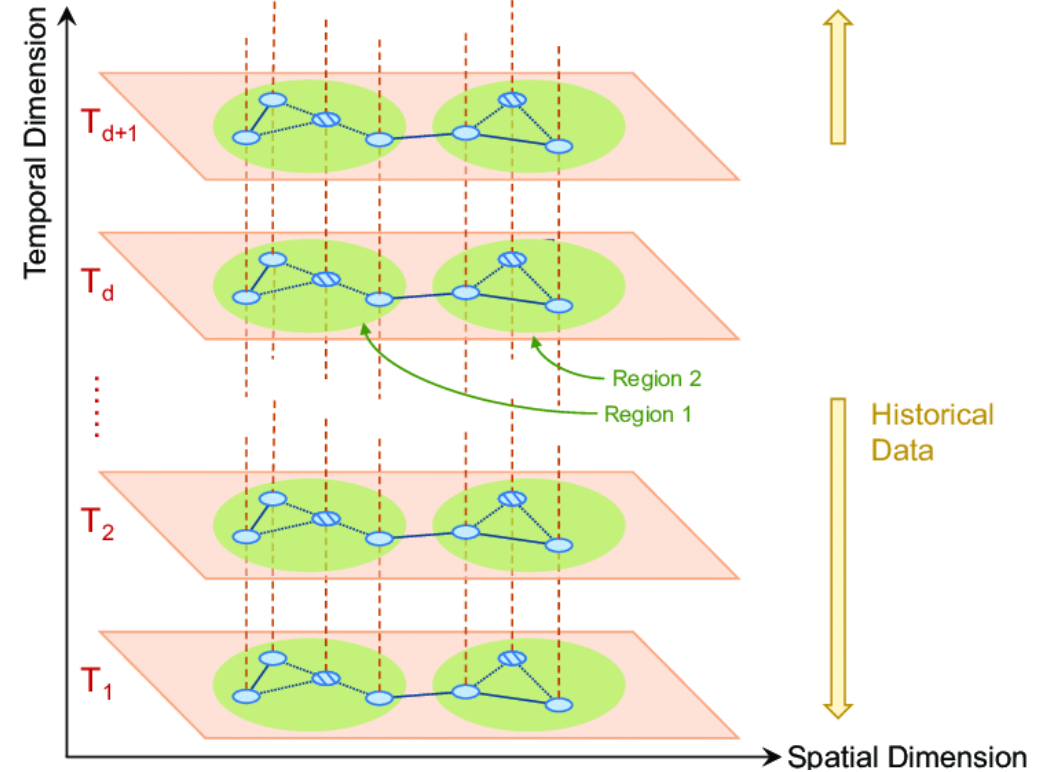

Distributed routing algorithm

Ant colony algorithm

Spatio-temporal graph

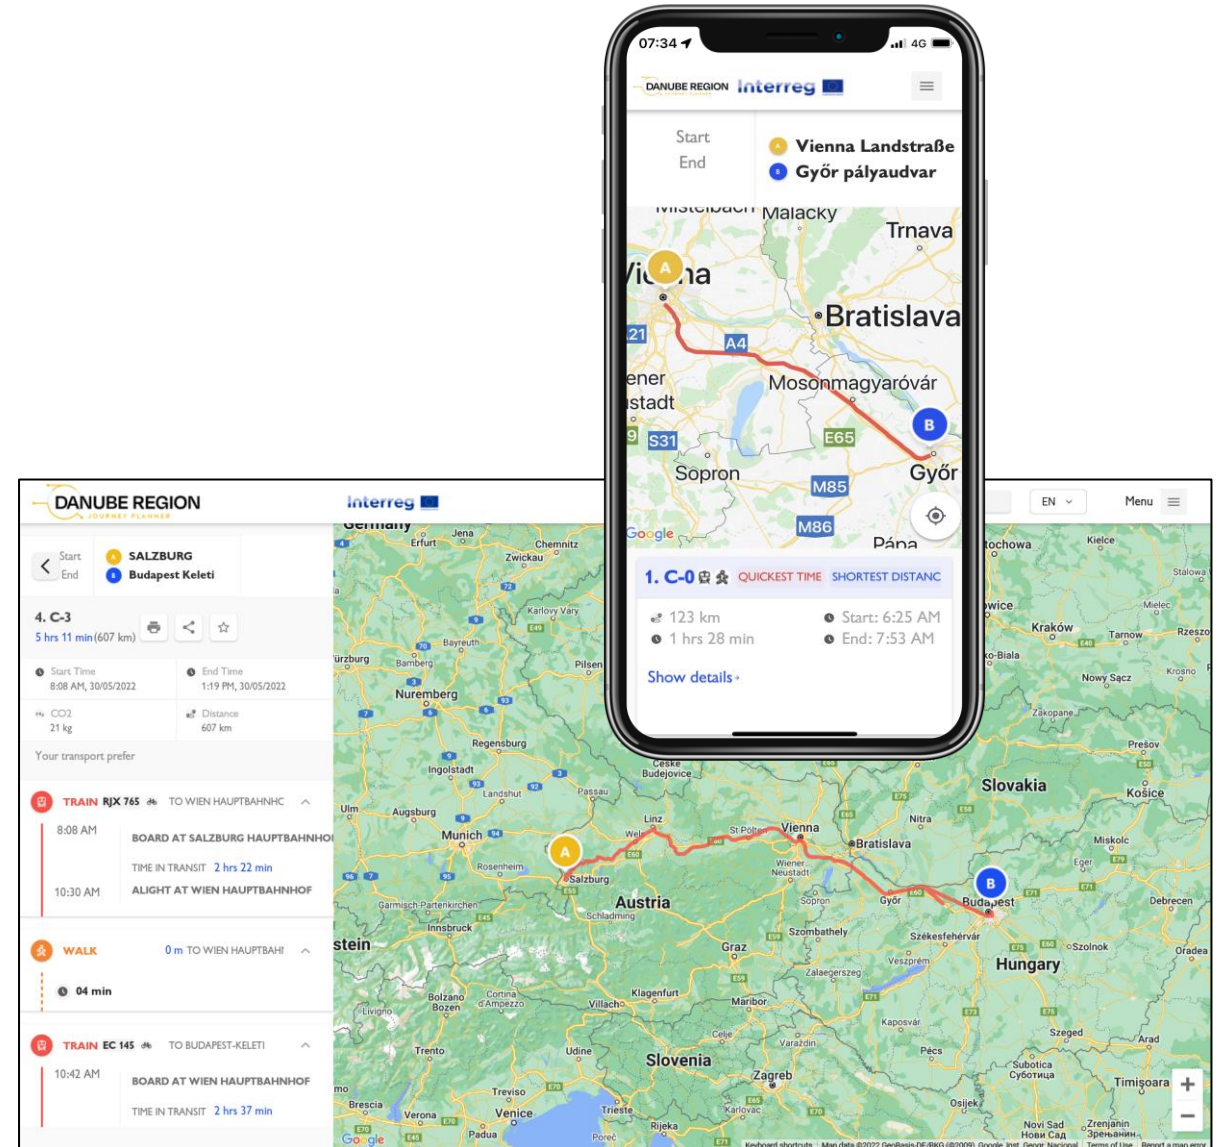

Danube Region Journey Planner App

Native Mobile App - Android

Native Mobile App – iOS

Mobile friendly Webpage

Technical Challenges

Harmonized interfaces (OJP – APIs)

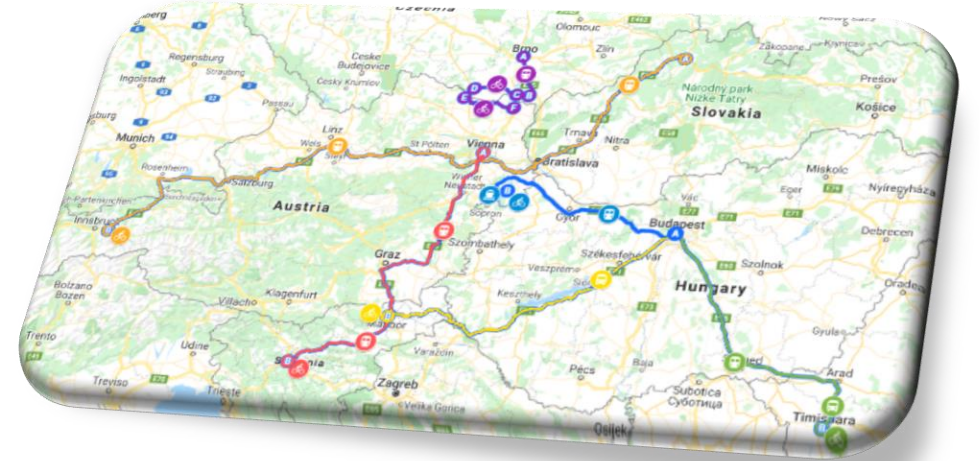

- Common Standard (OpenAPI - CEN/TS 177118)
- Selected OJP Profile
- Mock-up OJP Interface Validation Tool

Dynamic Selection of Exchange Points

- Dynamic algorithm

Entire chain performance

- EP selection performance
- LJP response times for complex/multiple queries

Thank you!
