

“Roberta Piccinini, vice-president mHealth Technologies srl (Bologna)”

"We took up a great challenge following a meeting with Eng. Tacconi and the group of researchers from the University of Bologna, so that in 2014 mHealth Technologies srl was founded," Roberta Piccinini, vice-president and administration manager, told us. We ask her how the project was originated, **a truly successful example of collaboration between association, enterprises and university**: "The birth of mHealth Technologies srl stems from the meeting of a group of entrepreneurs associated with CNA, belonging to the INNOVANET group, united by the conviction of the importance of networking to develop innovative projects, and a research group of the University of Bologna engaged in the development of digital solutions applicable in the healthcare field." In the context of a European Call for Proposals of the 7th Framework Programme that had led to the development of two prototypes, the entrepreneurs, following tests and market analysis, then decided to set up the company and industrialise the products, obtaining certification for medical devices and CE marking.

In particular, 2 medical devices have been developed:

- **A product for analysing movement, aimed at supporting the diagnosis of various neurogenerative pathologies.**
